

Major Filter Manufacturer Installs CMM Regenerative Thermal Oxidizer

When a leading manufacturer of filters for heavy duty diesel engines decided to expand production and install a pleated filter media production line with emission controls, they selected The CMM Group.

Equipped with a primary heat exchanger rated for 95% nominal thermal efficiency, the 3,000 scfm RTO from CMM is designed to destroy 95% of the airborne contaminants (phenol, formaldehyde, airborne smoke) found in the exhaust air of a new cure oven also being installed as part of the new production line.

Further information may be obtained by contacting The CMM Group, LLC at info@thecmmgroup.com.
