

## Graphic Arts Printer Producing Billions Of Labels Per Year Replaces Aging Emission Control System With CMM RTO

When a leading Wisconsin heat-set web printing operation that produces billions of labels annually needed to replace an aging, inefficient thermal recuperative oxidizer with a modern, energy efficient emission control system, they turned to The CMM Group.

The CMM RTO is designed to provide a 99%+ destruction efficiency for the maximum 170 pounds per hour of printing solvent VOCs present in the exhaust emissions from up to six graphic arts printing presses that operate 24 hours per day, 5 days per week. Installed on an outdoor concrete pad, the CMM unit also provides a 95% thermal efficiency to help reduce natural gas usage.
